# React JS

What is state? and why do we use useState in react js?

NEXT

State

state is the data that changes over time in a React application. It is stored in individual components and can be updated at any time.

useState

The useState hook is a special function that allows you to add state to a functional component. It returns an array with two values: the current state and a function to update it.

Here is an example of how to use the useState hook:

```
const [count, setCount] = useState(0);

function App() {
  return (
    <div>
      <h1>The current count is: {count}</h1>
      <button onClick={() =>
          setCount(count + 1)}>
          Increment Count

      </button>

    </div>
  );
}
```

NEXT

Why we want to use the useState hook?

1. To store data that changes over time.
2. To create interactive components.
3. To make your React applications more responsive.
